MEDIUM TYPE: 3.5 inch, 1.44 Mb floppy disk
COMPUTER: IBM PC COMPATIBLE
COMPUTER: TEM PC COMPATIBLE
COPERATING SYSTEM: PC-DOS/MS-DOS
SOFFWARE: WinPatin (Genentech)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/07/934,373C
FILLING DATE: 21-Aug-1992
CLASSIFICATION: 530
                                                                                                                           US-07-934-373C-42

Sequence 42, Application US/07934373C

Patent No. 5821337

Patent No. 5821337

                                                                                             This cDNA sequence encodes a mouse-human chimeric antibody light chain (AAW24512) in which the variable region is derived from mouse anti-human factor IX monoclonal antibody BC2 cDNA (see AA779899) and human sequences from the immunoglobulin RF-TS3'CL framework. It was obtained by PCR amplification (see AA779897-98) of BC2 cDNA and insertion of the PCR product into F9HIZHC 1-3 cDNA (see AA77774). Claimed anti-Factor IX chimeric antibodies are useful in the treatment of thrombosis.

                                                                                                                                                                                                                                    The invention relates to a method for treating an animal post-thromboembolic induced ischaemia or reducing a required dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischaemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences ABK23932-ABK24009 represent DNA molecules encoding antibodies and PCR primers used in the method of the invention.
                                         plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            172 CCTGCTCGCTTCAGTGGCAGTGGGTCTGGGACCTCTTACTCTCACAATCAGAGTG 231

                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                        This cDNA sequence encodes the light chain variable region (see ZAWA3520) of mouse anti-human Factor IX monoclonal antibody BC2. Claimed humanised antibodies (see AAWA3504-09) contain CDRs (see AAWA3504-09) of BC2 heavy and light chains inserted into framework regions of selected human antibody sequences. They have self. Infilting neutralising activity, and are useful as anticoagulant agents in treatment of thrombosis associated with myocardial infarction, unstable angina atrial fibrillation, stroke, renal camage, pulmonary embolism, deep vein thrombosis, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulation, sepsis, or artificial organs, shunts or prostheses (claimed). Also claimed are chimeric antibodies (see AAT79900), and Fab and F(ab')2 fragments. The claimed antibodies do not cause uncontrolled bleeding (contrast heparin and warfarin) since they provide only partial inhibition of coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; mouse; BC2; animal post-thromboembolic induced ischaemia; thrombolytic agent; anti-factor IX antibody; plasminogen activator; ss; thromboembolic stroke; cerebroprotective; anticoagulant; Thrombolytic; vasotropic; cardiant; PCR primer; anti-respiratory syncytial virus; heavy chain variable region; light chain variable region.

The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences ABK2393-ABK24009 represent DNA molecules encoding antibodies and PCR Primers used in the method of the invention.
                                                                                                                                                                                                                                       Treating post-thromboembolic induced ischaemia in an animal by administering anti-factor IX antibody in combination with a plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       52 AAGGICACAAIGACTIGCAGGGCCAGCICAAGIGIAAATIACAIGCACTGGIACCAGCAG 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This cDNA sequence was obtained by PCR amplification (see AAT79897 and AAT79898) of the light chain variable region (see also AAT7377) of mouse anti-human factor IX monoclonal antibody BCZ cDNA. The amplification resulted in the addition of Scai, NarI ends to the VL region. The PCR product was ligated into Scai, NarI edgested F9H2RC 1-3 (see AAT77374) and digested with Scai, NarI to produce a mouse-human chimeric light chain F9CHLC (see AAT79900, AAW24532). Claimed anti-Factor IX chimeric antibodies are useful in the treatment of thrombosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for treating an animal post-thromboembolic induced ischemia or reducing a required dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating post-thromboembolic-induced ischemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences ABK23932-ABK24009 represent DNA molecules encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating post-thromboembolic induced ischaemia in an animal by administering anti-factor IX antibody in combination with a plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expressed sequence tag; EST; probe; chemotactic; proliferative; immunomodulatory; haematopoietic; chemokinetic; analgesic; haemostatic; thrombolytic; antiinflammatory; cytostatic; antibacterial; antifungal; antiviral; antidiabetic; antiasthmatic; vulnerary; antiparkinsonian; antiviral; antidiabetic; antiasthmatic; vulnerary; antiparkinsonian; cerebroprotective; anticonvulsant; antidepressant; gene therapy; vaccine; autoimmune disorder; multiple sclerosis; allergic condition; insulin dependent diabetes; asthma; myeloid cell deficiency; ulcer; lymphoid cell deficiency; burn; osteoporosis; osteoarthritis;

                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                              chemokinetic; analgesic; haemostatic; thrombolytic; antinflammatory; chemokinetic; analgesic; haemostatic; thrombolytic; antinflammatory; cytostatic; antibacterial; antifungal; antiviral; antidiabetic; antibacterial; antifungal; antiviral; antidiabetic; antibacterial; antipacriatic; cerebroprotective; nootropic; antiparkinsonian; antipacriatic; cerebroprotective; anticonvulsant; and antidepressant. The sESTS can be used for gene therapy and in vaccines. The sESTS are useful as probes for the dentification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the sESTS. Proteins encoded by the sESTS are useful as probes for the antibodies. They may be useful for treatment of autinimume disorders antibodies. They may be useful for treatment of autinimume disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions of sathoporosis, osteoarthritis, central nervous system disorders (asthma); myelolid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, backersthritis, central nervous system disorders (canonis, backersin, thrombosis), inflammatory disorders (Crohn's disease), tumours, bacterial, fungal or viral infections, depression and psordasis. AAAA45926 to AAA45931 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                         expressed sequence tags (SESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders
                                                                                                                                                                                                                                                                                                                                                                                             AAA43426 to AAA45925 represent specifically claimed secreted expressed
                                                                                                                                                                                                                                                                                                                                                                                                             sequence tags (SESTS), isolated from human, mouse, chicken and rat tissue sources. The SESTS can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic;

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmne conditions. The cancer may be a tumour of the head and neck, stomach, composition for the treatment of cancer, infections and/or autoimmne conditions. The cancer may be a tumour of the head and neck, stomach, comptions, colon, liver, intrahepatic bile ducts, pancress, lung, laynx, breast, ovari, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, crotozoa or helminths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior conveils, Goognesture's syndiame, myasthenia gravis, insulin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present sequence encodes a fusion of an anti-CD20 single chain anti-dody and streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a.g. adenocarcinomas or hematological malignancies. The vector construct
is useful for expressing of streptavidin fusion proteins. In particular,
these are useful as tools for medical diagnostics and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.

The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interpossed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its
                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding a fusion of anti-CD20 single chain antibody/streptavidin.

functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.

The present sequence encodes a fusion of an anti-CD20 single chain antibody (BBE9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector constructs nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid conding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with concer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   e.g. adenocarcinomás or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a

                                                                                                                               The present sequence encodes a synthetic CD20-specific chimeric receptor. The specification describes CD-20 specific redirected T cells which express and bear on the cell surface membrane a CD20-chimeric receptor comprising an intracellular signalling domain, a transmembrane domain and an extracellular domain comprising a CD20-specific receptor. The genetically engineered CD20-specific redirected T cells are useful for treating a CD20+ malignancy, such as non-Hodgkin's lymphoma or CD20+ acute or chronic leukemia, in a human patient having previously undergone mycoblative chemotherapy and stem cell rescue. The genetically engineered CD20-specific redirected T cells are useful for abrogating an untoward B cell function, such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chains and 2 heavy chains, each comprising a constant human region and a variable non-human region. Coding sequences for the Ig chains are also claimed. The invention provides consensus sequences of light and heavy chain J regions useful in the design of oligonucleotides (UISs) for use as primers or probes for cloning immunoglobulinlight or heavy chain mRNAs or genes. Depending on the nature of design of a particular UIG, it may be capable of hybridizing to all Ig mRNAs or genes containing a single specific J equence. UIG denotes universal immunoglobulin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

The present sequence encodes the mouse antibody 2H7 light chain variable region. Antibody 2H7 is specific for human B-cell antigen. The antibody sequence was used to construct a chimeric human-mouse antibody. In the course of the invention. The chimmeric antibody is expressed in a secretion vector comprising a pelB pectate lyses secretion signal peptide. The pelB pectate lyses secretion sequence is useful for producing a protein such as a chimeric antibody in a bacterial host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          209 ACTCTCTCACAATCAGCAGAGTGGAGGCTGAAGATGCTGCCACTTATTACTGCCAGCAGT 268

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence, derived from M13 subclones of gene fragments, carries the variable region of chimeric immunoglobulin sequence. The antibodies ruseful in passive immunisation avoiding negative reactions. They are also useful in assaying and in vitro imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
